UX Case Study: Crafting a Seamless Plug And Charge Experience by Reducing Cross-Platform Friction

UX Researcher | 6 months

Project Overview

This document will be walking you through EVBox and ev.BMW, Hagen and Max are tasked to simplify the charging experience for EV owners.

Plug and Charge is a feature that allows EV drivers to charge their vehicle by simply plugging in the charging cable, without the need for authentication or payment.

The initiative addresses key user frustrations related to excessive discovery on the charging app, inconsistent UI/UX across platforms, and unreliable RFID authentication, ultimately improving reliability and user satisfaction for charging.

Problems Statement

Fragmented Charging Process

Multiple actions are required, including app authentication, payment setup, and manual start, leading to inconsistent user experience.

High Cognitive Load During Setup

Users must remember multiple charging cards/apps/accounts, which can be overwhelming. Multi-step user onboarding increases user abandonment.

Low Vehicle Confidence & Lack of Feedback

Users often lack real-time visibility into charging progress, leading to uncertainty about whether charging has started properly.

Poor End-to-End Integration

Limited synchronization between apps and charging networks causes the EV driver journey to be disconnected and inefficient.

Research

- User Interviews
- Surveys

Conducted 10 in-home and 10 virtual interviews with 10 BMW iX3 Owners. Participants represented diverse demographics, charging behaviors, and geographical locations to draw wider and actionable insights.

Research Objectives

Focused on understanding users' preferences/pain points regarding the need for charging expertise and the need for

User Pain Points

Data Privacy

Users are concerned about how much data is shared with third parties and how it is used.

Payment Process

Users are frustrated by the complex multiple-choice options and the confusing credit card details. Users also express concern about the security of their payment information and the potential for unauthorized charges.

Station Availability

Users frequently face issues with broken charging stations and inaccurate information about station availability. This leads to wasted time and frustration, especially when they are relying on the station for a specific charging session.

User Value

Value Statement: Our user research revealed the depth of user frustration and motivated multiple solutions for our design decisions.

> "I just want to plug in and charge. Why do I need to download an app, create an account, and enter my credit card every time?"

> "Every charging app is different and slows me down. Why can't they just work like my phone's payment system?"

> "I frequently experience issues with my charging app not working properly, and it's frustrating to have to troubleshoot the problem."

Research

- Customer Journey Analysis

We mapped the customer journey and found the pain points of charging frustration to be concentrated in the discovery, start, and end phases of the journey. Specifically, the discovery phase is where users struggle to find reliable charging stations, the start phase is where they struggle to authenticate and initiate charging, and the end phase is where they struggle to stop charging and pay for their session. Addressing these pain points can improve the overall ease of use and quality of the charging experience, as they are the most critical.

Research

- Competitive Analysis

	Apple CP Map	Tesla App	Integrations	Hyperbolics	Additional Value
Pros	Effortless charging, seamless integration with Apple Pay	Strong mobile charging app, reliable charging	Many vehicle + charger integrations	Wide variety, optimized for EV drivers	Fuel-centered user experience
Cons	Limited to Apple Pay, restricted to Apple ecosystem	Requires proprietary charger, limited to Tesla vehicles	Integrations not always reliable	Lower reliability in some regions	Reports of inaccurate information
Charge Time	Offers recommendations on charging times	Limited flexibility in charging time	Limited time optimization	Most advanced time optimization	Optimized scheduling
Price	Limited charging	Free supercharging after trial	Charging costs vary	Transparent pricing, no hidden fees	Cost-effective charging

Key Insights: The team identified opportunities to enhance the accessibility, trust, and integration. By tackling communication challenges and improving compatibility, EVmotion can position itself as a more reliable and user-friendly charging solution.

Research

- Persona Needs Analysis

We identified two primary personas for our charging experience: Tech-Savvy Commuter and Eco-Conscious Traveler. These personas were developed based on user research and data analysis, and they represent the key user groups we aim to serve. By understanding their needs, goals, and pain points, we can design a charging experience that is tailored to their unique requirements and preferences.

Tech-Savvy Commuter

With a career spanned the varying charging app that I have to open the correct one.

Eco-Conscious Eco-Traveler

Frequent Customer Support Requests (customers reporting issues with charging sessions, failed payments, or app crashes)

Persona Alignment

Tech-savvy Commuter as the ideal user for our charging experience. This persona's familiarity with technology and their frequent use of charging stations make them a valuable source of feedback and insights. By designing a charging experience that is tailored to their needs, we can create a more efficient and user-friendly experience for them.

Lack of Integration with Vehicle

Users have to manually start and stop charging sessions, which can be inconvenient and time-consuming.

Research

- Priority Ranking

Vehicle Connection

Ensuring a reliable and secure connection between the vehicle and the charging station.

Payment Simplicity

Automated payment that requires minimal user intervention.

Real-time Data Utility

Accurate, timely information on charging status, estimated completion time, and cost.

Charging Initiation

Seamless and intuitive process for starting a charging session.

Design Opportunities

Minimize Manual Steps

We discovered that by integrating plug-in-by-selecting, we can significantly reduce the number of manual steps required for charging. By automating the authentication process, we can eliminate the need for users to enter their credentials or payment information manually. This will not only save users time but also reduce the risk of errors or frustration. Overall, this opportunity has the potential to significantly improve the user experience of charging.

Trust and Transparency

We addressed concerns over data privacy by making app permissions clear and transparent, and by providing users with control over their data. We also built trust by displaying real-time charging updates and providing clear, accurate information about charging costs. By addressing these concerns, we can create a more trustworthy and reliable charging experience. These opportunities can help to increase user adoption and satisfaction, leading to a more successful charging ecosystem.

Design Opportunities

Zero Time Wasted

The overarching purpose was centered around to improve user efficiency, which can be done by minimizing the repeating and redundant steps. This means to prevent repeated flows to prevent users from having to repeat the same actions multiple times. For example, users should not have to authenticate with each charging session, and once a charge effectively ended or abnormally stopped, no redundant steps like re-charging authentication.

Process Based Alignment

The experience was designed to reflect the mental model that drivers have when charging their vehicles. This ensures that the experience aligns with their thought processes, making it intuitive and easy to navigate. For example, the charging process can be broken down into three stages: pre-charging, charging, and post-charging. Each stage has its own set of tasks and goals, and the experience should be designed to support these tasks and goals.

High Level User Flow

Validating And Refining Through User Testing

Vehicle Connection

Iteration

Iteration Testing Of Core Flows

After several rounds of testing, adjusting, and iterating, we validated three critical flows: Vehicle Connection, Charging Initiation, and Charging Completion. These flows underwent multiple refinements to ensure a seamless, intuitive, and error-free experience.

Refining Decision Based on User Insights

Feedback from testing often had contrasting or non-actionable insights. Our team prioritized changes that aligned with core user goals and business objectives. For example, we removed the Post-Experience Survey after users found it unnecessary and disruptive.

Accessibility Considerations

Touch Targets

Minimum size of 44 x 44 for better interaction and touch accuracy.

Language & Labels

Use of simple, approachable language (avoid EV-specific terminology).

Color Contrast

Color combinations are used with sufficient contrast for readability.

UI Design Rationale

Visual Hierarchy

Primary actions are emphasized, while secondary actions remain accessible.

Consistency

Consistent use of UI patterns for BMW vehicle integration.

Error Clarity

Clear, actionable error messages for quick resolution.

Final Iteration Of UI Design Concepts

Results

Support

- Reduced Drop-off Rate During Charging Setup
- Improved Task Success Rate
- Reduced Support Requests

Retention

- Increased Repeat Usage
- Higher Customer Satisfaction Scores

Other

- Lower Abandonment Rate
- Faster Authentication Time
- Improved Vehicle Integration
- Increased Trust in Data Privacy
- Positive Customer Feedback

Impact

Business Value

Streamlined charging experience can increase user retention and drive higher adoption rates for BMW's charging network.

Customer Satisfaction

Reduced friction and improved reliability can lead to higher customer satisfaction scores and positive brand perception.

Competitive Advantage

Seamless integration can differentiate BMW's charging solution from competitors.
